

Vision Systems and PPG Announce Window Shading Applications Partnership

PPG and Vision Systems have announced a partnership to codevelop new applications that make use of the latter's electronically dimmable window technology for aircraft. PPG, which has supplied electrochromic window shading systems for commercial airplanes and ground vehicles since 2007, says it will work with Lyon-based Vision Systems to pursue opportunities to capitalize on each company's expertise across all sectors of the aviation industry. "As a pioneer in the electrochromic window segment, PPG recognized the added value offered by Vision Systems to the standard dimmable film technology, especially with the interface that makes its system work," said Brent Wright, PPG's global business director of Aerospace Transparencies.
