PXCom and Vision Systems Unveil Flexible Wireless IFE System

PXCom and Vision Systems have unveiled a new wireless in-flight entertainment system called Visi-Stream. The companies are touting the system's flexible graphical user interface (GUI), which integrates PXCom's end-to-end XPlore solution, enabling digital content on aircraft servers to be updated from a ground-based platform. "Updating the GUI, from simple design changes to additional sections was a pain point for the airlines," said Cyril Jean, CEO of PXCom. "Airlines can now choose to change both the user experience and the content management in a few clicks." Vision Systems will showcase Visi-Stream at next month's Aircraft Interiors Expo in Hamburg.
